

Boom Lifts

Boom Lifts are a table lift device that could be lifted or lowered to varying heights, making this machine a practical tool for various manufacturing functions. There are some unique kinds of Boom Lift consisting of knuckle booms, scissor lifts, and aerial hoists, each functioning in a different way.

Aerial hoists are most commonly utilized to carry people at ski lodges who are not comfortable with a ski lift. These lifts function much like an elevator, snowboarders can be gradually shuffled up the mountain, stopping at stations along the route until they reach the top. Aerial hoists are also used in construction, moving workers safely up and down the sides of multi-level construction sites.

Scissor hoists are quite regularly utilized by service businesses as the perfect method to safely permit staff to mend and work on cables and wires attached to poles. Telephone, cable television and power companies have relied on the proficiency of this style of boom lift for years.

The knuckle boom lift is created for use within locations of rough terrain and where the need to change course could be required. This kind of boom lift has the ability to fit in tight spots where a scissor lift cannot fit. Working amid multiple equipment in a manufacturing facility or in near proximity between two walls, the knuckle boom also features a standard table outfitted with rails for protection and worker safety.

The style of boom lift needed by corporations will normally depend on the nature of the work needed. Luckily, there are suitable designs for almost any task.
