

Victoria Manlift Training

Victoria Manlift Training - Different manlift training programs consist of the review and content of manlift devices. An essential portion of the program is the practicum where students demonstrate their knowledge and practical ability to operate the manlift safely. A prerequisite to Manlift training is the fall protection training, that may be incorporated in the training according to the particular requirements of the client.

Course Content

The course content includes: pre-shift equipment inspection and work area survey requirements; the impact of performing unsafe acts or using unsafe machinery, Review of load capacities, Lifting device machine definitions, the specific machine requirements and safety decals, Review of related sections of the CSA Standards as well as the OHSA Standards and Review site particular Dangers, along with controls for safe use of a lifting device.

Demonstration and Evaluation Content

Evaluation and demonstration content consists of: Proper personal protective equipment or also known as P.P.E. as needed; Using a signaler or a spotter when required; making use of the right fitting harness or fall arrest device; Operating a lift just on level and solid ground; Utilizing the lift with all other staff clear of the job site; Aware of load limitations etc. and other specs as set out by the manufacturer; Having all associated machinery stored safely on the lift platform; Pre-shift work area survey and machine check; Isolating off the work place when major work projects are to be done; and ensuring a safe and smooth operating speed for various plant conditions

Each individual will be tested to make sure they can efficiently and safely operate your site-specific machinery.

Manlift Safety

Because the manlift is capable of lifting personnel and materials more than 20 feet in the air, these machinery pose a particular amount of danger and could be dangerous machines if not utilized properly. Since the danger is so apparent, lift operators and owners are careful to correctly maintain their machinery and follow right safety measures and operating procedures. The ratio of accidents involving this specific machinery is quite low.

The safety specifications for boom lifts and scissor lifts puts the burden for safe manlift operation on the user. You are responsible for knowing how to safely utilize the lift even if you only lease the equipment for one day. The most basic safety features on the equipment are safety decals and the operating guidebook. These show essential information regarding the maintenance, operating procedures and safety machinery.

Newer lift models would come with instruction manuals and decals in place. Technically, the operating manual should be kept on the lift itself. If you are buying a used lift, it is important to make sure that the guidebook is included and that vital decals haven't been painted over. The restraints which prevent operators from falling and the guardrails are other vital safety features. These are standard and mandatory on all types of lifts.
