

Victoria Manlift Certification

Victoria Manlift Certification - The Elevated Platforms and Manlifts Certification course helps to provide the required training on the safe operating procedures, work practice, regulations and rules regarding the everyday activities for the operators of this machine. The course has been designed for individuals who are actively involved in these activities or those who have a basic knowledge of this machine.

Aerial platforms and manlifts have become common and integral machines in industrial settings in the last few decades. These machinery provide an easy way to lift employees close to what has to be performed on a stable platform apparatus, allowing workers to carry out tasks with greater comfort and safety rather than being perched on top of ladders or scaffoldings.

The manlift is similar to other industrial tools in that they are safe if used properly. Because they lift staff above ground level or floor, accidents could take place easily and this could lead to serious injuries or death for both the operators of the manlift as well as any passerby who may not be lucky enough to be standing beneath.

Manlifts come in various models. The majority fit into 1 or 2 categories: the scissor lift, that is capable of moving upward and downward and the articulating boom lift, that can move both vertically and horizontally.

Protecting Workers

It is essential to provide correct training for you operators. Many businesses that rent these machinery would offer on site training. Each and every worker who would be working on the equipment or operating it has to receive training in safe operations. It is also important that only those employees who have received training should be authorized to operate the controls. Communication rules and operating procedures must be clear. Thus, staff on the ground must not operate controls without the knowledge and approval of any staff in the basket.

Those employees who would be occupying the basket are required to wear correct fall protection such as lanyard and a harness. That protection should be connected to the manlift itself and not to a nearby surface. The worker has to make certain that she or he has made whatever adjustments required to reflect the change in fall distance if the height of the work area changes.

Manlifts must be inspected and tested every day to make sure they are in safe operating condition. Prior to making use of the machinery, whatever defects have to be re-checked and fixed.
